

Monkeypox Testing Decision Tree for Providers

Patient with concern for MPX → Rash (with or without other symptoms) consistent with MPX?¹

YES

NO

Remember to consider other etiologies for rash:

- STIs: including syphilis and herpes
- Chickenpox, scabies
- Molluscum contagiosum
- Hand foot and mouth, diaper rash
- Heat rash, bug bites, allergies

No lesion to test, assess 14-day exposure history²

High or Medium risk exposure history:
Contact LHD⁴ to assess for PEP³ and/or monitoring

Low/no risk exposure history:
Have patient return if rash develops

Assess 14 day exposure history²

High-risk exposure history examples:

- Contact with known MPX case
- Multiple or anonymous sex partners, especially from a place/community where MPX is circulating
- Other intimate contact or risky exposures in place where MPX is circulating

- Notify local health department (LHD)⁴ so they can prepare for possible case
- Test at reference lab or with CDEpi approval at MTPHL**
- Patient should isolate pending test results
- Consider testing for other/concurrent STIs (e.g., HIV, syphilis, gonorrhea, chlamydia)

Medium-risk exposure history examples:

- Contact with rash of unknown etiology
- Sexual exposure, unsure of partner's history
- Skin-to-skin contact with others (e.g., sports, concerts, crowds)

- Discuss with LHD⁴
- Consider testing at reference lab, at provider's discretion
- Patient should isolate pending test results
- Consider testing for other etiologies for rash including STIs, if appropriate

Low/no risk exposure history:

- No sex/skin-to-skin contact with others
- Low-risk sex: monogamous
- No travel, or travel but no intimate contact or high-risk exposures

- Consider discussing with LHD⁴
- Consider testing at reference lab, at provider's discretion
- Consider testing for other etiologies for rash

** Testing at MTPHL run Tues/Thurs with epi approval
